

Super-insulate with Spray Foam !

Cut utility bills substantially

Spray applied polyurethane foam seals all cracks, voids and gaps by expanding 100 times its volume into a semi-rigid insulation and air seal. It eliminates air infiltration which is the leading cause of energy loss.

Eliminate condensation

Closing soffits, gable and ridge vents with spray foam insulation prevents 90% of moisture intrusion, 40% of energy loss, and eliminates duct condensation.

Accumulated condensation in typical 6" insulated flex duct

Reduce wind-driven rain damage

The Florida Hurricane Advisory Committee supports unvented attics because it stops the wind driven rain through soffits and gable ends that was the second highest cause of damage during Hurricane Charlie.

(FEMA Research Study 490)

Reduce dirt and allergens

The unvented attic keeps out dirt, dust, critters and allergens for a much cleaner house. It also reduces humidity making it difficult for dust mites to survive. The

American Lung Association uses this system in all of its demonstration homes.
