

Create an “unvented attic system” with spray foam insulation

Think of the “unvented attic” as a foam cooler placed over the top of your house. It stops over 90% of the sun’s radiation and all the air infiltration.

The AC equipment and ducts in the attic are cool reducing both the load on the AC and the tonnage needed. Vented attics typically reach over 130°.

Since the soffits are closed, no more airborne pollutants and allergens make it into your house. It also stops wind-driven rain in storms.
